UK private rented sector data

Briefing paper
Prof Scott Orford (Cardiff University) and Dr Jennifer Harris (University of Bristol)
3 September 2020
About the authors

Professor Scott Orford is the Data Director for the UK Collaborative Centre for Housing Evidence (CaCHE). He is a Professor in Geographic Information Science and Spatial Analysis at Cardiff University and is the Research Data Manager and Data Integration Co-ordinator of the Wales Institute of Social and Economic Research, Data and Methods (WISERD).

Dr Jennifer Harris is a Senior Research Associate for the UK Collaborative Centre for Housing Evidence (CaCHE), and is based in the School for Policy Studies, University of Bristol.

Acknowledgements

This is part of the third project carried out as part of the collaboration between CaCHE, the TDS Charitable Foundation and the SafeDeposits Scotland Charitable Trust. Through this collaboration we are undertaking a diverse programme of research on issues relating to developments in, and operation of, the UK private rented sector. The broad objective of the programme is to contribute to raising standards in the UK private rented sector.

Statistics on the UK Private Rented Sector .......................................................................................................................................................................... 9
Background

The UK private rented sector (PRS) has evolved substantially over the past 15 years and has been the focus of significant policy change. Adequate data availability is key to understanding the sector, the way in which it is changing and the impact and effectiveness of different policy measures. A wide range of surveys and other statistics provide a considerable amount of information on the sector. However, concerns have been raised about several key data gaps which hinder our ability to understand the impact of recent legislation and develop effective regulatory responses. This briefing paper identifies and provides a critical commentary of the main data sets which are available across the UK.

Key datasets on the UK PRS

The best quality information on the PRS comes from data drawn from large scale national surveys or large-scale administrative datasets. The Appendix summarises nearly 30 key datasets that could be used to estimate the size of the PRS in each jurisdiction. These data sets give an indication of the size of the sector and other details regarding the experience and characteristics of people living in the sector (e.g. demographics, rent payments, moves within the sector). These statistics also give an indication of standards and several charities and pressure groups have expressed alarm at the extent of disrepair within sector.

There are however certain limitations associated with these statistics. They do not include information on landlord behaviour regarding management of the property, for example, whether a deposit has been protected. This can pose significant challenges for policy makers and regulatory agencies. Disaggregated data and granular geographical information are key if local authorities are to develop strategies that exert effective leverage on the various types of landlords and local housing market conditions. A sufficiently disaggregated picture of the private rented sector is necessary to give precise estimates of compliance with different legislative requirements and allow enforcement action to be targeted accordingly.

Data type

The majority (19) of the datasets are cross-sectional surveys of a sample of the population taken annually (a small number are quarterly). This means that although we can get a yearly snapshot of the PRS, it is difficult to produce trends over time because the sample, and therefore the mix of PRS characteristics, will change each time. The only longitudinal survey that can allow us to understand how the PRS is changing is the Understanding Society study which is produced by the Institute for Social and Economic Research at the University of Essex. It includes various questions relating to respondent’s housing situation and other areas of their lives – income, wealth, partnership, fertility, education, employment, and health. Most questions are asked every year of the same set of persons which provides insights into how people’s housing experiences change over time and how they inter-relate with other aspects of their lives. The survey is representative of the UK and therefore the findings can be generalised to the wider population. This information is especially useful in following individual and household’s housing pathways in and out of the PRS. It is less useful in understanding how the PRS housing stock is changing.

---

2 Office for National Statistics UK Private Rented Sector 2018
Administrative datasets are collections of statistics that are compiled by government departments and agencies during their day-to-day activities. Administrative datasets covering the PRS (9) can provide more detailed information on the housing stock, including basic information on average rents and some information on property characteristics. Administrative datasets can also be more complete in terms of the number of PRS properties because they are not necessarily based on samples. However, the completeness of both survey and administrative datasets in capturing the PRS is dependent on the criteria used to determine inclusion in the dataset and quite often this means that certain sections of the PRS will be missing. The national decennial Census of Population is the most complete dataset to capture the numbers in the PRS, but this is a 10 yearly snapshot so has limitations in understanding how the PRS is changing.

Data content
The datasets vary on the topics and variables they contain. The majority of the large government household surveys have a wide range of demographic, household composition, socio-economic and dwelling variables including information on tenure and the PRS. They tend to have limited information on landlord or tenant behaviour, characteristics of the physical stock and financial data. Information on rents can be obtained from administrative data although this can be limited to simple averages.

Geography
The datasets identified are all national in scope although only 7 have a whole UK focus. It is more typical for survey and administrative datasets to be for a devolved nation - England (6), Wales (4), Scotland (5), Northern Ireland (5), and England and Wales (1). This limits the ability to undertake UK-wide analysis because definitions and methodologies tend to vary between nations, as does the type of data collected, and this is especially the case for administrative datasets. The ability to make housing law and policy has been devolved to the UK nations so some divergence in how housing is monitored and measured is to be expected. However, increased comparability between different nations would be helpful because it would facilitate policy learning.

In terms of geographic granularity, all the datasets allow national figures to be produced with Regional and Local Authority (15) breakdowns available for the majority of datasets (6). Very few datasets allow breakdowns below the level of Local Authority area due to sample size restrictions, although some of the larger government surveys do allow access to finer geographies via secure access agreements. The Census is the only large dataset that provides robust numbers at small scale geographies, but the currency of the data limits its use. This lack of low-level geographical data has significant implications for local authorities’ ability to analyse their local housing markets and develop an evidence-based approach to managing the sector.

Time period
Nearly all the datasets are current; a small number are no longer being updated but have been included because they still contain data of interest. Some datasets date back over twenty years or more so can provide a picture of long-term changes in the PRS, bearing in mind the limitations of using cross-sectional data in analysing trends and the possibility of changes in definitions, methodology and data categorisation.
Other key datasets

UK wide

**Family Resources Survey (UK wide):** is a continuous household survey that collects information on a representative sample of private households in the UK and includes information on tenure. In 2017/18 over 19,000 households were interviewed.

**Annual population survey (UK wide):** is a continuous household survey based on the Labour Force Survey covering the UK which includes questions on housing. Available at Local Authority level.

**Census of Population (England and Wales; Scotland; Northern Ireland):** provides details about all people and households who lived in the PRS. Data is available at very low-level geographies. Samples of micro-data and longitudinal data are available through special licenses. However, it is only collected every 10 years and it is 2 years or more before it is made available. The size and nature of the PRS has changed rapidly over recent years. Census is therefore unlikely to provide an accurate picture, or if so, only for a very limited period of time.

**Understanding Society (US) / British Household Panel Survey (BHPS):** is a continuous UK household longitudinal study. Built on BHPS which ran from 1991-2009 and had 10,000 households. US started in 2009 and has around 40,000 households / 100,000 individuals including 8,000 households from the BHPS. Includes data on housing, has an immigrant and ethnic minority boost sample, allows low level (below local authority) geographical analysis, and can be linked to administrative data. Allows the investigation of short- and long-term changes to tenure.

**Index of Private Housing Rental Prices:** experimental index for prices paid for renting property from private landlords in the UK. Breakdown for four nations, English regions, 4 dwelling types and furnished / unfurnished accommodation.

**Buy to Let:** survey undertaken with a sample of Council for Mortgage Lenders (CML) members (banks, building societies and other lenders) from 2013. Includes information on Lending to First time buyers and home movers. Information available for English regions, Wales, Scotland and Northern Ireland.

**England**

**English Housing Survey (ENS):** a continuous online survey taken with approximately 13,300 households.

**Labour Force Survey (LFS):** estimates of the PRS in England are taken from the LFS and smoothed. This survey only covers occupied dwellings. To prevent vacancy rate biasing the PRS estimate, data on vacancy from the ENS is used to make adjustment.

**English Private Landlord Survey:** a national survey of nearly 8,000 landlords and letting agents who own and/or manage privately rented properties in England. Uses data from the tenancy deposit protection schemes and therefore does not include data on landlords who are not protecting tenancy deposits.

**Private Rental Market Statistics for England (Scotland and Wales have similar data):** annual release of mean, median, lower quartile and upper quartile total monthly rent paid, for a number of bedroom/room categories by English Local Authorities. Data collected by the Valuation Office Agency to support Local Housing Allowance. As sample of properties change each year, not possible to directly compare statistics to infer trends over time.

**Wales**

**National Survey for Wales (including Welsh Housing Conditions Survey):** a continuous survey of around 12,000 people a year across Wales. Includes a range of questions on people’s housing. Allows local authority level analysis. WHCS based on physical inspections of a sample of 2,500 properties in the NSW 2017-18. Allows national level estimates of the condition and energy efficiency/performance of the housing stock in Wales.
Energy Performance of Buildings Certificates (England and Wales): data are drawn from two datasets on the Energy Performance of Buildings Registers covering England and Wales. Data (including floor area) of domestic and non-domestic buildings which have been constructed, sold or let since 2008. Available at local authority level.

Scotland

Scottish Household Survey (including Scottish House Condition Survey): collects data from a randomised representative sample in Scotland from all local authorities since 2012. Sample size is approximately 10,000. It provides data to a local authority level but not at lower geographies. As discussed above there may be different housing markets at a very small and local level. A compliance problem may exist in certain areas but not in others.

Other surveys (Scotland): These have been identified as possibly increasing our knowledge of the sector: Scottish Crime and Justice Survey, the Scottish Health Survey, Scottish Household survey.

Northern Ireland

Northern Ireland Housing Statistics 2017-18: a compendium of the latest statistics drawn from a wide range of mainly Government sources including national surveys (eg NI Continuous Household Survey).

Discussion

Whilst there are several data sets which provide an indication of the size of the private rented sector, there are still several gaps in what we know about the sector. There is very little information on landlord behaviour and their compliance with different regulatory requirements and a lack of geographically specific data. The PRS is not a homogeneous market and people’s experiences of living in the sector are driven by relatively small local markets. It is not possible to understand what is going on at a geographically specific area without more granular data.

The issue of poor data availability on a low-level geographical basis has particular implications for the role of local authorities in encouraging adherence to the regulation. Developing interventions to address non-compliance depends on the ability to i) determine if a compliance problem exists in their area, and ii) identify the reasons for this behaviour. Where non-compliance is the result of ignorance or inadvertence this would require less interventionist measures such as education or awareness raising. If non-compliance is the result of intentional criminal behaviour, formal enforcement will be a more appropriate response. None of the key datasets identified above provides information on landlord behaviour that could support local authorities in developing effective and appropriately targeted regulatory strategies.

---

Data gaps in the private rented sector were highlighted in the Office for Statistics Regulation report on Statistics on Housing and Planning in the UK and the ONS UK Private Rented Sector: 2018 report. Both reports concluded that existing data only presents a partial picture and more is needed to be done on providing coherent and robust statistics that can be compared over time, across geographies and at the local level; issues which have also been highlighted here.

Government statistical agencies are working towards addressing some of these gaps as part of a wider programme of harmonising statistics across the UK, including providing improved access to existing data on housing statistics including the PRS. The recent Digital Economy Act 2017 has also allowed government statistical agencies access to private rental data which was previously constrained due to legislation around taxpayer confidentiality. The ONS is also looking at using more experimental approaches such as Big Data (e.g. using data from the property website Zoopla), using supplementary micro-data, and linked administrative data to produce rent statistics and dwelling stock information for small areas (e.g. Welsh Government’s Housing Stock Analytical Resource for Wales (HSAR) programme).

Provision in the Digital Economy Act 2017 should allow analysis of micro-rental data alongside Tenancy Deposit Protection Scheme data whilst also linking this data to administrative and micro-data to provide a more complete picture of the PRS. The continuing data harmonisation programme is important to allow comparisons across geographies and joined-up working between different agencies, for example in relation to the tenancy deposit schemes, is crucial here. There needs to be more dialogue between data custodians and data users on different needs and requirements – there has already been some important in-roads here in relation to the PRS in general, but it appears that the full potential to address some of the data gaps has yet to be realised.

Recommendations

Although this report highlights some encouraging developments, there needs to be continued and sustained emphasis on the development of private rented sector data by UK government statistical agencies.

UK and devolved governments need to improve the accessibility and quality of data which is available to local authorities on the private rented sector. As discussed in a separate report, we believe that appropriately designed national systems of registration or licensing are key in providing local authorities with the data they need to regulate the sector effectively.

UK and devolved governments should explore how aggregate administrative data sets such as national registration scheme data could be made available on a lower geographical level. In England, a national system of registration should be introduced.

UK and devolved governments should continue to explore opportunities to improve harmonisation and comparability of data between nations to facilitate learning from different policy developments. Data sets also need to be improved to allow comparisons over time so we can better understand the nature of the sector and how it is changing.

As explored above, there are gaps in our understanding of the stock of the private rented sector, what it looks like and how it has changed over time. UK and devolved government should ensure adequate statistics are available to measure the sector both at an aggregate and at a local housing market level.
